How to Build
A Micro Compound Lever Briquette Press
Parts List, Notes, Drawings and Assembly
Designed for North American lumber size
1½” x 3½” (38 mm x 89 mm)

English & Metric Dimensions

This small press is suggested for single-family use, classroom demonstrations, or a small village operation where a small footprint, low cost, and easy to build press using hand tools are required.

The press has a low build cost (about $18.00 U.S. dollars), is easy to build using hand tools, is lightweight at 26 pounds (12 kg) and can create a force far in excess of that required to make a high quality briquette (typically in excess of 4,000 pounds or 1,800 kg). Briquettes can be produced at a rate of about twelve in ten minutes depending of type of mold used.
INTRODUCTION

The Design:
The Micro Compound Lever Press has been designed and improved for use in developing countries where it is important to consider the ease of construction from a low cost local building material. Wood easily satisfies both requirements whereas metal may require a higher skill level, be in limited supply, or be cost prohibitive by comparison. The press can be constructed with a minimal skill level using power tools or hand tools.

The press is capable of creating a force far in excess of that required to make a high quality biomass briquette. For example, with 70 pounds (32kg) of force on the handle, the force on the briquette located 4 inches (100 mm) from the end pivot point, will be 4,000 lb (1,800kg). Based on a typical biomass pressing requirement of 145 lb/in² (65 kg/in²) of force, the required pressure on a 3 inch (75 mm) briquette with a 1 inch (25 mm) hole would be 900 lb (400kg). A 4 inch (100 mm) square briquette with no hole requires about 2,300 lb (1,040kg). A 6 inch (150 mm) diameter briquette with no hole requires about 4,000 lb (1,800kg) of force. The press can easily exceed these force requirements.

Two versions of the press are configured to satisfy different skill levels and construction methods. Both versions require bracing for support, one version uses an actual brace while the other version accomplishes bracing from notches. The braced version is easier to build while the notched version eliminates the brace but requires a higher skill level. Both versions can create an equal amount of press force, use the same amount of lumber, weigh the same 26 pounds (12kg), and cost the same ($18.00). Both use three, 8’ (2,440 mm) long sections of standard dimensioned lumber 1½” X 3½” 38 mm x 89 mm) plus standard dimension hardware. We recommend the brace version because it requires the least skill level and performs exceptionally well.

Type of Wood: Soft wood can be used for both versions, however, if available, we recommend hardwood for the high pressure lever arm (Part C) to increase durability. Select wood with straight grain and no knots for parts C, E, G and H.

Water resistant coating, if available, apply polyurethane, paint, thinned motor oil, or whatever the local area can provide. Store in a dry and sun free location during periods of nonuse.

Bolts & Nuts: Not all locations of the world have a ready supply of bolts & nuts. Previous builders have had good success using metal pipe or metal rods pined with roll-pins or even nails.

Modifications: preserving and recycling the water used for the biomass mixture can be accomplished a number of ways. If the clearance below the press is inadequate for your container, adjust the length of the legs, A & B below the base D to accommodate. You may wish to tilt the press forward allowing water to drain to the end and into a tray. Groves in the base can assist that drainage. See step 15 for a suggested reduction is weight and wood usage.

Briquette Molds:
The press has a compression range from 12½” (300 mm) to 7½” (190 mm) and can be used for briquettes made from Biomass, BioChar or Charcoal Fines. See the document “Easy BioMold - Your Choice” for a wide variety of mold designs suitable for this press.

Cost: is based on material purchased from Home Depot, March, 2012, USA. If you have questions regarding the construction of this press please contact us through the web site below.

Note: Nominal dimensions are 1½” x 3½” (38 mm x 89 mm) and the performance characteristics are based on these standard dimensions. The builder may need to adjust the plan dimensions accordingly to compensate for the lumber found in the country where the press is being built. There is also a press version based on lumber size 40 mm x 100 mm. You can download the plans from the web site.

Construction & Assembly (Brace Version)

1. Select wood with straight grain and few knots if possible. If hardwood is plentiful and inexpensive, use hardwood for part C, otherwise, softwood will be okay.
2. Cut material per the parts list using the cutout diagram as a guide for efficient use of lumber.
3. Sand and smooth edges to remove splinters.
4. Drill 3/8” (10 mm) bolt holes per the dimensioned parts diagram.
5. Holes in the lower section of parts A & B are 4” (100 mm) from the bottom and centered on the stock. Drill one hole accurately in part A and use it as a guide to drill the other A and the two B’s. Clamp as necessary.

6. Part G should be drilled using one as a guide for the other. Drill the two holes in one piece of Part G and one hole in the second G. Using a 3/8” (10 mm) bolt to pin the two together as a guide to drill the second hole in the remaining G. Drill across the grain for maximum strength.

7. Bolt Legs A & B to part D using (2) 3/8” (10 mm) x 5½” (140 mm) bolts. Position part D to locate the holes to the bottom side as shown. Hand tighten all bolts until final assembly is complete.
8. Assemble arms G to C as shown using a 3/8” (10 mm) x 5½” (140 mm) bolt, 4-washers and a nut.

9. Connect the C G assembly to part A using a 3/8” (10 mm) x 6½” (170 mm) bolt, 4-washers and a nut. Position part C to locate the hole for part G to the top side as shown.
10. Connect part E to leg B using a 3/8” (10 mm) x 6½” (170 mm) bolt, 4-washers and a nut.

11. Raise part G and connect to handle E using a 3/8” (10 mm) x 5½” (140 mm) bolt, 4-washers and a nut.
12. Connect part H to the existing bolts in legs A & B. Make certain the bolt for part G under the notch is installed with the head end showing and not the nut end. Part H can be installed on either side depending if the operators are right handed or left handed. (Right hand version shown)
13. Handle E should open to this position.

14. Attach part F, F & J using 2½” (65 mm) wood screws or 3” (75 mm) nails.
15. If you want minimize the weight and wood usage you can eliminate one of the two parts “F” and attach F to the top side of Part D as shown above. This will reduce the opening between F and C by 1 ½” 89 mm. If you need to maintain the 7 ½” opening between F and C, extend the length of legs A & B by 1 ½” 89 mm.

16. Adjust the bolt tightness for Part G to allow for adequate handle movement. Completely tighten the other four bolts. Part K can be used for extra stability if the press sets in soil or on a rocky surface.

17. If available, coat the press with a water resistant finish like paint, polyurethane, used motor oil, lard or grease. If the finish is in limited supply it is best to at least coat parts D, F, J and the lower part of legs A & B.

When motor oil is used it helps to thin the first coat. Allow time for the wood to absorb the oil then apply a second coat using regular strength oil.

Notches 3/4" deep
Construction & Assembly (Notch Version)

1. Select wood with straight grain and few knots if possible. If hardwood is plentiful and inexpensive, use hardwood for Part C, otherwise, softwood will be okay.
2. Cut material per the parts list using the cutout diagram as a guide for efficient use of lumber.
3. Sand and smooth edges to remove splinters.
4. Drill 3/8” (10 mm) bolt holes per the dimensioned parts diagram.
5. Holes in the lower part of parts A & B are 4” (100 mm) from the bottom and centered on the stock. Drill one hole accurately in part A and use it as a guide to drill the other A and the two B’s. Clamp as necessary.
6. Accurately cut notches in parts A, B and D as shown in the dimensions diagram. Careful attention to crafting a tight joint will enhance the press operation.

7. Part G should be drilled using one part as a guide for the other. Drill the two holes in one Part G and one hole in the second G. Using a 3/8” (10 mm) bolt to pin the two together as a guide to drill the second hole in the remaining G. Drill across the grain for maximum strength.

8. Lay out Legs A, B1 & B2 and insert into the notch for part D as shown.
9. Stand the two assemblies upright as shown. Insert a 3/8” (10 mm) x 6½” (165 mm) bolt thru B1, thru spacer L and into B2. Insert a 3/8” (10 mm) x 8” (200 mm) bolt thru the A end as shown. Position plate F between the two side rails D, level and secure using 2½” (65 mm) wood screws. Hand tighten all bolts until final assembly is complete.

10. Assemble arms G to C as shown using a 3/8” (10 mm) x 5½” (140 mm) bolt, 4-washers and a nut.
11. Connect the C G assembly to part A using a 3/8” (10 mm) x 8” (200 mm) bolt, 4-washers and a nut. Position part C to locate the holes for part G to the top side.

12. Connect handle E to leg B using a 3/8” (10 mm) x 5½” (140 mm) bolt, 4-washers and a nut.
13. Raise part G and connect to handle E using a 3/8" (10 mm) x 5½" bolt, 4-washers and a nut.

14. Handle E should open to this position.

15. Attach J using 2½" wood screws or 3" nails
16. Adjust the bolt tightness for Part G to allow for adequate handle movement. Completely tighten the other four bolts.

17. If available, coat the press with a water resistant finish like paint, polyurethane, used motor oil, lard or grease. If the finish is in limited supply it is best to at least coat parts D, F, J and the lower part of legs A & B.

When motor oil is used it helps to thin the first coat. Allow time for the wood to absorb the oil then apply a second coat using regular strength oil.
